Restaurant Billing System

AIM:

To develop a Python program that calculates the total restaurant bill for multiple dishes. The program identifies premium and regular dishes based on price, calculates service charge, and classifies the final bill as high or normal.

Code with Errors:

```
print("Restaurant Billing")

items = int(input("Enter number of dishes: "))
i = 0
total = 0

while i < items:
price = int(input("Enter dish price: "))
total = total + price

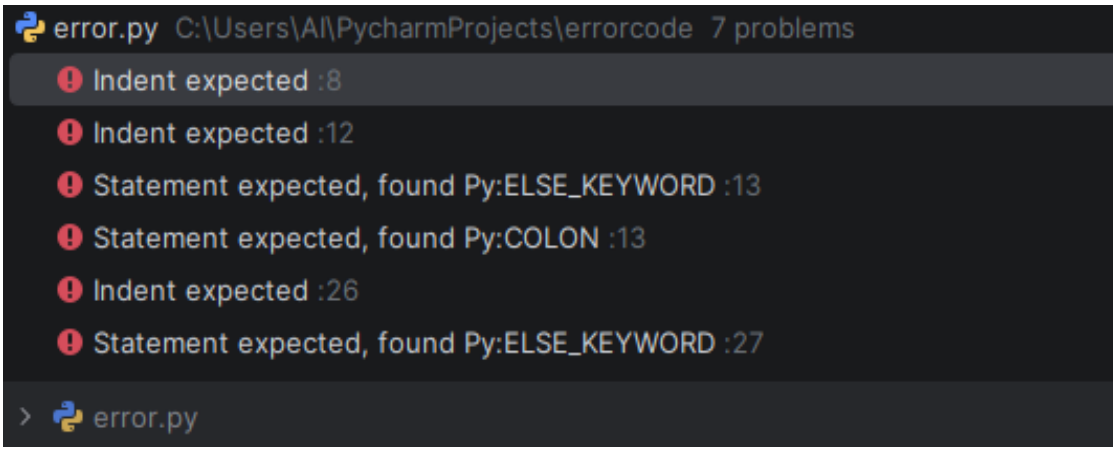
if price > 500:
print("Premium dish")
else:
print("Regular dish")

i = i + 1

service = total * 10 / 100
grand_total = total + service

print("Total:", total)
print("Service Charge:", service)
print("Grand Total:", grand_total)
```

```
if grand_total > 3000:
print("High bill")
else:
print("Normal bill")
```



List of Errors:

1. Improper indentation inside while loop.
2. Incorrect indentation of if condition.
3. Incorrect indentation of else block.
4. Print statements not indented properly.
5. Increment statement indentation issue.
6. Final if-else block indentation error.
7. Program will raise IndentationError.
8. Poor code formatting.

Corrected Code:

```
print("Restaurant Billing")

items = int(input("Enter number of dishes: "))
i = 0
total = 0

while i < items:
```

```
    price = int(input("Enter dish price: "))
    total = total + price

    if price > 500:
        print("Premium dish")
    else:
        print("Regular dish")

    i = i + 1

service = total * 10 / 100
grand_total = total + service

print("Total:", total)
print("Service Charge:", service)
print("Grand Total:", grand_total)

if grand_total > 3000:
    print("High bill")
else:
    print("Normal bill")
```

```
C:\Users\AI\PycharmProjects\errorcode\.venv\Scripts\python.exe C:\Users\AI\PycharmProjects\errorcode\correct.py
Restaurant Billing
Enter number of dishes: 2
Enter dish price: 250
Regular dish
Enter dish price: 240
Regular dish
Total: 490
Service Charge: 49.0
Grand Total: 539.0
Normal bill

Process finished with exit code 0
```
